Introduction to Machine Learning

Machine Learning is a branch of Artificial Intelligence that allows computers to learn patterns from data and make predictions or decisions without being explicitly programmed for every task.

Types of Machine Learning

1. Supervised Learning: The model learns from labeled data. Examples include classification and regression.
2. Unsupervised Learning: The model finds patterns in data without labeled answers. Clustering is a common example.
3. Reinforcement Learning: An agent learns by interacting with an environment and receiving rewards or penalties.

Key Point

Machine Learning uses data, algorithms, and models to solve problems and improve performance.
